

MediaPulse Sky User Interface

The right user interface for your facility management software.

Product Overview

The MediaPulse Sky UI is the most powerful web UI available. Using the latest web controls and innovative ideas allow for efficient presentation and entering of data. The MediaPulse layout editor allows administrators and users to personalize all web and mobile layouts by department or user.

Dashboards contain multiple panels of any size. Panels contain multiple search lists, layouts, reports, web widgets/gadgets, charts/gauges or a URL to display web pages or custom apps. Dashboards save search, report and chart criteria for a user customized display. MediaPulse advanced technology allows dashboards to display immediately even when searching through millions of rows. Panels automatically update for real time display.

Users may customize their dashboards based on security. Personalization includes theme, layouts, data filtering, sorting, field order and width. Create buttons for common actions to save mouse clicks. Set favorites for frequently used applications or for a particular job or order.

Features and Benefits

- Internationalized to any language
- Multi time zone and currency
- Modify all web/mobile layouts
- Dashboards support web widgets and custom gadgets
- Favorites for applications or data
- Multiple themes
- Customize buttons saves clicks
- All prompts may be changed
- Many preferences by user
- Export selected rows to Excel or report
- In-line editing
- Auto filter and fill similar to Excel
- Grid and rapid update
- Sort by multiple fields
- Advanced field filtering
- Drill down everywhere based on security
- Relative date searching
- Schedule recurring emailed reports
- Embedded report writer
- User creates charts and gauges with pan and zoom
- Customize field hover text for quick help
- Auto dial phone numbers

Searching

Searching is very powerful in MediaPulse. All fields may be searched, sorted and totaled. Shared or private filter lists allow single click to display data. Personalized default filters minimize mouse clicks. Drag on any field to group rows by that field and instantly show totals. Drill down everywhere to show data you have access to. Both grid and rapid update are features for quickly updating data across many rows. Searches auto-refresh and therefore new work automatically displays. Export selected rows to Excel or a report. Search by date and user added or changed to help find data.

Data Entry

Customize all layouts by user. Notes support fonts, color, highlights, bullets, numbering and spell correction. Attach Word/Excel documents to any data. Drag cells to copy data similar to Excel. Icons display next/previous rows from search lists. Uses may hide messages saving clicks. The recent document lists allows single click to view last 50 rows edited.

Charts

Users easily create charts and gauges on any data in MediaPulse. Create in seconds a multi-axis bar graph showing order totals by account rep by year, month, or week. Create a gauge showing total jobs by type for the month. With relative dates create an area graph showing all transcodes for last week and the next two weeks.

Reports

Reports use the same advanced searching, filtering and relative date techniques. Schedule reports to recur at any time and email to any group of users. The Recent Reports list allows a single click to run one of the last 50 reports executed. Filter criteria show on report header.

Notifications

Alerts is a quick way to send messages to multiple users. Send alerts to all users logged, based on an event or recurring to remind a user to run a report at the end of each month. Hyperlinks is a handy feature to send any document to users. Inside an order click to create a hyperlink and paste to an alert or email to a user or client. The recipient clicks on the link and the document automatically opens.
